

# langkah langkah build angular 19 upload ke windows server jelaskan dengan detail

Berikut adalah langkah-langkah detail untuk build dan upload aplikasi Angular 19 ke Windows Server dengan IIS:

# **Persiapan dan Build Production**

#### Langkah 1: Build untuk Production

Buka terminal di root project Angular dan jalankan perintah build production: [1] [2]

```
ng build --configuration production
```

Untuk aplikasi yang akan ditempatkan di subdirektori (bukan root), gunakan parameter basehref: [3]

```
ng build --configuration production --base-href /nama-aplikasi/
```

# Langkah 2: Verifikasi Output Build

Setelah build selesai, akan terbentuk folder dist yang berisi semua file production. Struktur folder akan seperti: [4] [2]

# Konfigurasi Windows Server

# Langkah 3: Install URL Rewrite Module

Download dan install IIS URL Rewrite Module dari Microsoft. Module ini diperlukan untuk mendukung Angular routing dan mencegah error 404 saat direct navigation. [5] [3]

# Langkah 4: Buat Web.config

Buat file web.config di dalam folder dist/nama-project/browser/ dengan konfigurasi berikut : [6]

```
<?xml version="1.0" encoding="utf-8"?>
<configuration>
 <system.webServer>
   <rewrite>
     <rules>
        <rule name="Angular Routes" stopProcessing="true">
          <match url=".*" />
          <conditions logicalGrouping="MatchAll">
            <add input="{REQUEST FILENAME}" matchType="IsFile" negate="true" />
            <add input="{REQUEST_FILENAME}" matchType="IsDirectory" negate="true" />
          </conditions>
          <action type="Rewrite" url="./index.html" />
        </rule>
     </rules>
    </rewrite>
  </system.webServer>
</configuration>
```

# Deploy ke IIS

### Langkah 5: Copy Files ke Server

Copy seluruh isi folder dist/nama-project/browser/ ke direktori web server, misalnya C:\inetpub\wwwroot\nama-aplikasi\. [7] [3]

# Langkah 6: Konfigurasi IIS Site

- Buka IIS Manager
- Klik kanan pada Sites dan pilih Add Website [7]
- Atur Site Name, Physical Path ke folder yang berisi file build, dan Port [3]
- Untuk virtual directory: klik kanan website default, pilih **Add Application**, dan arahkan ke folder build [3]

#### **Langkah 7: Set Application Pool**

- Buka Application Pools di IIS Manager
- Pilih application pool untuk website
- Set .NET CLR Version ke No Managed Code karena Angular adalah static files [7]

# **Troubleshooting**

# **Error 404 pada Direct Navigation:**

Pastikan web.config sudah benar dan URL Rewrite Module terinstall. Verifikasi bahwa base href di index.html sesuai dengan path aplikasi. [3]

#### File JS/CSS Tidak Load:

Periksa kembali base href dalam index.html dan pastikan sesuai dengan struktur direktori di IIS. Jika aplikasi berada di subdirektori, gunakan parameter --base-href saat build. [3]

# Aplikasi Hanya Menampilkan Loading:

Buka Developer Tools dan periksa Console untuk error JavaScript. Pastikan semua file static dapat diakses dan tidak ada masalah CORS. [3]

Setelah semua langkah selesai, aplikasi Angular 19 sudah dapat diakses melalui browser pada alamat yang dikonfigurasi di IIS. [8] [7]
